Scientific context

Context: Create real-time digital twins of an organ (e.g. liver).

Objective : Develop an hybrid finite element / neural network method.

accurate quick + parameterized

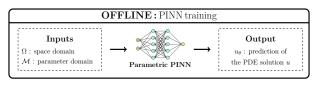

Parametric elliptic convection/diffusion PDE : For one or several $\mu \in \mathcal{M}$, find $\mu:\Omega \to \mathbb{R}$ such that

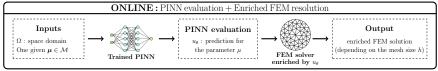

$$\mathcal{L}(u; \mathbf{x}, \boldsymbol{\mu}) = f(\mathbf{x}, \boldsymbol{\mu}), \tag{P}$$

where ${\cal L}$ is the parametric differential operator defined by

$$\mathcal{L}(\cdot; \mathbf{x}, \boldsymbol{\mu}) : u \mapsto R(\mathbf{x}, \boldsymbol{\mu})u + C(\boldsymbol{\mu}) \cdot \nabla u - \frac{1}{\mathsf{Pe}} \nabla \cdot (D(\mathbf{x}, \boldsymbol{\mu}) \nabla u),$$

and some Dirichlet, Neumann or Robin BC (which can also depend on μ).

Remark: The PINN prediction enriched Finite element approximation spaces.

Physics-Informed Neural Networks

Standard PINNs ¹ (Weak BC): Find the optimal weights θ^{\star} , such that

$$\theta^* = \underset{\theta}{\operatorname{argmin}} \left(\omega_r J_r(\theta) + \omega_b J_b(\theta) \right), \tag{\mathcal{P}_{θ}}$$

with

residual loss
$$\int_{r}(\theta) = \int_{\mathcal{M}} \int_{\Omega} \left| \mathcal{L} \left(u_{\theta}(\mathbf{x}, \boldsymbol{\mu}); \mathbf{x}, \boldsymbol{\mu} \right) - f(\mathbf{x}, \boldsymbol{\mu}) \right|^{2} d\mathbf{x} d\boldsymbol{\mu},$$
 boundary loss
$$\int_{b}(\theta) = \int_{\mathcal{M}} \int_{\partial \Omega} \left| u_{\theta}(\mathbf{x}, \boldsymbol{\mu}) - g(\mathbf{x}, \boldsymbol{\mu}) \right|^{2} d\mathbf{x} d\boldsymbol{\mu},$$

where u_{θ} is a neural network, g=0 is the Dirichlet BC.

In (\mathcal{P}_{θ}) , ω_r and ω_b are some weights.

Monte-Carlo method : Discretize the cost functions by random process.

¹[Raissi et al., 2019]

Physics-Informed Neural Networks

Improved PINNs¹ (Strong BC): Find the optimal weights θ^{\star} such that

$$\theta^* = \underset{\theta}{\operatorname{argmin}} \left(\omega_r J_r(\theta) + \underline{\omega_b} J_b(\theta) \right),$$

with $\omega_r = 1$ and

residual loss
$$\int_{r}(\theta) = \int_{\mathcal{M}} \int_{\Omega} \left| \mathcal{L} \left(u_{\theta}(\mathbf{x}, \boldsymbol{\mu}); \mathbf{x}, \boldsymbol{\mu} \right) - f(\mathbf{x}, \boldsymbol{\mu}) \right|^{2} d\mathbf{x} d\boldsymbol{\mu},$$

where u_{θ} is a neural network defined by

$$u_{\theta}(\mathbf{x}, \boldsymbol{\mu}) = \varphi(\mathbf{x})w_{\theta}(\mathbf{x}, \boldsymbol{\mu}) + g(\mathbf{x}, \boldsymbol{\mu}),$$

 $\partial\Omega = \{\varphi = 0\}$ $\Omega = \{\varphi < 0\}$ $\varphi > 0$

with φ a level-set function, \textit{w}_{θ} a NN and g=0 the Dirichlet BC.

Thus, the Dirichlet BC is imposed exactly in the PINN : $u_{\theta} = g$ on $\partial \Omega$.

¹[Lagaris et al., 1998; Franck et al., 2024]

Finite Element Method¹

Variational Problem:

Find
$$u_h \in V_h^0$$
 such that, $\forall v_h \in V_h^0$, $a(u_h, v_h) = I(v_h)$, (\mathcal{P}_h)

with h the characteristic mesh size, a and l the bilinear and linear forms given by

$$a(u_h,v_h) = \frac{1}{\text{Pe}} \int_{\Omega} D \nabla u_h \cdot \nabla v_h + \int_{\Omega} \textit{R} \, u_h \, v_h + \int_{\Omega} v_h \, \textit{C} \cdot \nabla u_h, \quad \textit{I}(v_h) = \int_{\Omega} \textit{f} \, v_h,$$

and V_h^0 the finite element space defined by

$$\textit{V}_{\textit{h}}^{0} = \left\{\textit{v}_{\textit{h}} \in \textit{C}^{0}(\Omega), \; \forall \textit{K} \in \mathcal{T}_{\textit{h}}, \; \textit{v}_{\textit{h}}|_{\textit{K}} \in \mathbb{P}_{\textit{k}}, \textit{v}_{\textit{h}}|_{\partial\Omega} = 0\right\},$$

where \mathbb{P}_k is the space of polynomials of degree at most k.

Linear system : Let $(\phi_1, \ldots, \phi_{N_b})$ a basis of V_b^0 .

Find
$$U \in \mathbb{R}^{N_h}$$
 such that $AU = b$

with

$$A = (a(\phi_i, \phi_j))_{1 \le i, j \le N_h}$$
 and $b = (I(\phi_j))_{1 \le j \le N_h}$.

$$\mathcal{T}_h = \{K_1, \dots, K_{N_e}\}$$
(N_e: number of elements)

¹[Ern and Guermond, 2004]

How improve PINN prediction with FEM?

Additive approach

Variational Problem : Let $u_{\theta} \in H^{k+1}(\Omega) \cap H_0^1(\Omega)$.

Find
$$\rho_h^+ \in V_h^0$$
 such that, $\forall v_h \in V_h^0$, $a(\rho_h^+, v_h) = I(v_h) - a(u_\theta, v_h)$, (\mathcal{P}_h^+)

00000 0000 00000

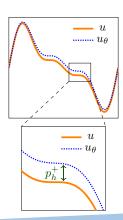

with the enriched trial space V_h^+ defined by

$$V_h^+ = \left\{ u_h^+ = u_\theta + \rho_h^+, \quad \rho_h^+ \in V_h^0
ight\}.$$

General Dirichlet BC: If u = g on $\partial \Omega$, then

$$p_h^+ = g - u_\theta \quad \text{on } \partial\Omega,$$

with u_{θ} the PINN prior.

Convergence analysis

Theorem 1: Convergence analysis of the standard FEM [Ern and Guermond, 2004]

We denote $u_h \in V_h$ the solution of (\mathcal{P}_h) with V_h the standard trial space. Then,

$$|u-u_h|_{H^1}\leqslant C_{H^1}\,h^k|u|_{H^{k+1}},$$

$$||u-u_h||_{L^2} \leqslant C_{L^2} h^{k+1} |u|_{H^{k+1}}.$$

Theorem 2: Convergence analysis of the enriched FEM [Lecourtier et al., 2025]

We denote $u_h^+ \in V_h^+$ the solution of (\mathcal{P}_h^+) with V_h^+ the enriched trial space. Then,

$$|u-u_h^+|_{H^1} \leqslant \left| \frac{|u-u_\theta|_{H^{k+1}}}{|u|_{H^{k+1}}} \right| \left(C_{H^1} h^k |u|_{H^{k+1}} \right),$$

$$||u - u_h^+||_{L^2} \leqslant \left| \frac{|u - u_\theta|_{H^{k+1}}}{|u|_{H^{k+1}}} \right| \left(C_{L^2} h^{k+1} |u|_{H^{k+1}} \right).$$

2D Poisson problem on Square - Dirichlet BC

2D Anisotropic Elliptic problem on a Square - Dirichlet BC

2D Poisson problem on Annulus - Mixed BC

Problem considered

Problem statement: Considering an Anisotropic Elliptic problem with Dirichlet BC:

$$\begin{cases} -\mathrm{div}(\mathbf{D}\nabla u) = f, & \text{in } \Omega, \\ u = 0, & \text{on } \partial\Omega, \end{cases}$$

with $\Omega = [0,1]^2$ and $\mathcal{M} = [0.4,0.6] \times [0.4,0.6] \times [0.01,1] \times [0.1,0.8]$ ($\emph{p}=4$).

Right-hand side:

$$f(\mathbf{x}, \boldsymbol{\mu}) = \exp\left(-\frac{(\mathbf{x} - \mu_1)^2 + (\mathbf{y} - \mu_2)^2}{0.025\sigma^2}\right).$$

Diffusion matrix: (symmetric and positive definite)

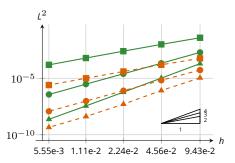

$$D(\mathbf{x}, \boldsymbol{\mu}) = \begin{pmatrix} \epsilon x^2 + y^2 & (\epsilon - 1)xy \\ (\epsilon - 1)xy & x^2 + \epsilon y^2 \end{pmatrix}.$$

PINN training: MLP with Fourier Features¹ of 5 layers; Adam optimizer (15000 epochs). Imposing the Dirichlet BC exactly in the PINN with a level-set function.

2D Poisson problem on Square - Dirichlet BC
2D Anisotropic Elliptic problem on a Square - Dirichlet BC
2D Poisson problem on Annulus - Mixed BC

Problem considered

Problem statement: Considering the Poisson problem with mixed BC:

$$\begin{cases}
-\Delta u = f, & \text{in } \Omega \times \mathcal{M}, \\
u = g, & \text{on } \Gamma_E \times \mathcal{M}, \\
\frac{\partial u}{\partial n} + u = g_R, & \text{on } \Gamma_I \times \mathcal{M},
\end{cases}$$

with
$$\Omega=\{(\textbf{x},\textbf{y})\in\mathbb{R}^2,\ 0.25\leq \textbf{x}^2+\textbf{y}^2\leq 1\}$$
 and $\mathcal{M}=[2.4,2.6]$ ($\textbf{p}=1$).

Analytical solution :

$$u(\mathbf{x}; \boldsymbol{\mu}) = 1 - \frac{\ln\left(\mu_1 \sqrt{x^2 + y^2}\right)}{\ln(4)},$$

Boundary conditions:

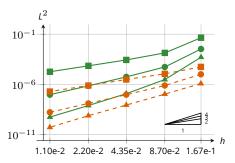

$$g(\mathbf{x};\boldsymbol{\mu}) = 1 - \frac{\ln(\mu_1)}{\ln(4)} \quad \text{and} \quad g_{\mathrm{R}}(\mathbf{x};\boldsymbol{\mu}) = 2 + \frac{4 - \ln(\mu_1)}{\ln(4)}.$$

PINN training: MLP of 5 layers; LBFGs optimizer (4000 epochs). Imposing the mixed BC exactly in the PINN¹.

Conclusion

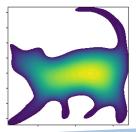

Conclusion and Perspectives

• PINNs are good candidates for the enriched approach. Appendix 2

- Numerical validation of the theoretical results.
- The enriched approach provides the same results as the standard FEM method, but with coarser meshes. \Rightarrow Reduction of the computational cost.

Perspectives:

- Consider non-linear problems. Appendix 1
- Use PINN prediction to build an optimal mesh, via a posteriori error estimates.
- Validate the additive approach on more complex geometry.

Appendix

Appendix 1: Non-linear problems

TODO

Appendix 2 : Data-driven vs Physics-Informed training

Appendix 2: Problem considered

Problem statement: Consider the Poisson problem in 1D with Dirichlet BC:

$$\begin{cases} -\partial_{xx} u = f, & \text{in } \Omega \times \mathcal{M}, \\ u = 0, & \text{on } \partial\Omega \times \mathcal{M}, \end{cases}$$

with $\Omega = [0,1]^2$ and $\mathcal{M} = [0,1]^3$ (p=3 parameters).

Analytical solution : $u(x; \mu) = \mu_1 \sin(2\pi x) + \mu_2 \sin(4\pi x) + \mu_3 \sin(6\pi x)$.

Construction of two priors: MLP of 6 layers; Adam optimizer (10000 epochs). Imposing the Dirichlet BC exactly in the PINN with $\varphi(x) = x(x-1)$.

• Physics-informed training: $N_{\rm col} = 5000$ collocation points.

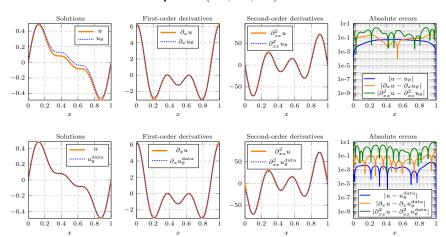

$$J_r(\theta) \simeq \frac{1}{N_{\mathsf{col}}} \sum_{i=1}^{N_{\mathsf{col}}} \left| \partial_{\mathsf{xx}} u_{\theta}(\mathbf{x}_{\mathsf{col}}^{(i)}; \boldsymbol{\mu}_{\mathsf{col}}^{(i)}) + f(\mathbf{x}_{\mathsf{col}}^{(i)}; \boldsymbol{\mu}_{\mathsf{col}}^{(i)}) \right|^2.$$

- Data-driven training: $N_{\mathrm{data}} = 5000~\mathrm{data}.$

$$J_{\mathrm{data}}(\theta) = rac{1}{N_{\mathrm{data}}} \sum_{i=1}^{N_{\mathrm{data}}} \left| u_{ heta}^{\mathrm{data}}(\mathbf{x}_{\mathrm{data}}^{(i)}; oldsymbol{\mu}_{\mathrm{data}}^{(i)}) - u(\mathbf{x}_{\mathrm{data}}^{(i)}; oldsymbol{\mu}_{\mathrm{data}}^{(i)})
ight|^2.$$
